

MICROFAST *E. COLI* 0157

Immuno-chromatographic test for detection of *Escherichia coli* O157 in food

Escherichia coli is a common organism found in the lower intestinal tract of humans and animals. There are, however, some strains of the bacterium that can cause harm to the human body. The most common of these strains is *E. coli* O157:H7, which can be commonly found in raw/undercooked beef, raw/unpasteurized milk, and sewage-contaminated water. Infection by the *E. coli* O157:H7 bacteria may lead to the acute disease hemorrhagic colitis and/or the chronic disease hemolytic uremic syndrome (HUS).

MICROFAST *E. Coli* 0157, intended to detect *E. Coli* in food, will allow to take decisions quicker and reduce the assay cost.

Kit Features:

- * Rapid: 5 minutes
- * Ready and easy to use
- * Visual interpretation of results
- * Lab equipment not needed
